February 15, 2014

Dear Colleague,

My medical group in Central Virginia is pioneering novel methods for fat reduction. In our work at our center it has become clear that the amount of inflammatory fat-soluble debris that results from fat cell disruption is significant, regardless of methodology. Cold clamping, laser, heat, and ultrasound ablation methods all lead to release of the inflammatory cytokines inherent in fat cells, along with fat soluble toxins that are difficult for kidney and liver detox pathways to handle. There is limited regulation on these modalities, and we would like to keep it this way. Through the responsible practice by the industry, we can keep the technology advancing and available to the largest population to improve the health of Americans.

While your facility is ultimately in healthy competition with the spread of our fat-ablation technology, it is important to all modalities in the field that we share best-practice methods and resources with one another to ensure that fat-ablation technologies continue to produce the safest, and most effective results.

As such, I strongly recommend that you take a look at the product Watt-Ahh that is produced in Florida by the Sarasota based company AquaNew. This product is difficult to believe upon first hearing about it, and essentially has to be experienced to be understood. The water is produced through a unique technology that adds electrons to the molecular arrangements of hydrogen and oxygen elements in H₂O to result in a novel anti-inflammatory water.

The use of Watt-ahh at our medical clinic has resulted in immediate reduction of inflammation, and can result in visible oils and fat soluble debris clearance through the urine within the first few days of use. We have made created a mandatory post-treatment Watt-Ahh hydration regimen for fat ablation therapies in our center that last a minimum of one week. We hope that you and your other colleagues in the field will continue to pass on this information and share your experiences in your center as you utilize the product in order to continue to improve client safety and clinical outcomes.

Sincere Regards,

Zachary M. Bush, MD
